## SKELTANA RIUCHT

The Old West Frisian Skeltana Riucht (from here on referred to as SR) is a lawtext that is small in scope and size. It contains 6857 words ${ }^{1}$, which belong to 781 lexical units. In this study a lexical unit should be understood to consist of the word(s) that occur(s) as a single entry in Von Richthofen's Altfriesisches Wörterbuch. To give an example: is, se(e), sen, si, sint, wa(e)s, were, weren, wessa and wessen are ten different words, but they compose a single lexical unit ${ }^{2}$.

A word frequency count and subsequent arrangement of the data results in the following statistical survey:

| A | B | C | D | E | F | G | A | B | c | D | E | F | G |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 1 | 347 | 347 | 781 | 100 | 685 | 00.- | 30 | 3 | 90 |  | 4.74 | 411 | 60.01 |
| 2 | 126 | 252 | 434 | 55.57 | 6510 | 94.94 | 31 | 2 | 62 |  | 4.35 | 4025 | 58.70 |
| 3 | 75 | 225 | 308 | 39.44 | 6258 | 91.26 | 32 | 1 | 32 | 32 | 4.10 | 3963 | 57.79 |
| 4 | 36 | 144 | 233 | 29.83 | 6033 | 87.98 | 35 | 4 | 140 | 31 | 3.97 | 3931 | 57.33 |

| 27 | 1 | 27 | 42 | 5.38 | 4255 | 62.05 | 299 | 1 | 299 |  | 30.38 | 1628 | 23.74 |
| 28 | 3 | 84 | 41 | 5.25 | 4228 | 61.66 | 547 | 1 | 547 | 2 | 20.26 | 1329 | 19.34 |
| 29 | 1 | 29 | 38 | 4.87 | 4144 | 60.44 | 782 | 1 | 782 | 1 | 0.13 | 782 | 11.40 |
| A. the frequency (f) with which a lexical unit occurs; |  |  |  |  |  |  |  |  |  |  |  |  |  |
| $B$ : the rank $(r)$ that the lexical unit holds in the frequency-list; |  |  |  |  |  |  |  |  |  |  |  |  |  |
| $C$ : the product of the corresponding figures in $A$ and $B$; |  |  |  |  |  |  |  |  |  |  |  |  |  |
| $D$ : the sum of the figures in $B$ from the bottom of the survey upwands; |  |  |  |  |  |  |  |  |  |  |  |  |  |
| $E$ : the percentage represented by the figure in D; |  |  |  |  |  |  |  |  |  |  |  |  |  |
| $F$ : the sum of the figures in $C$ from the bottom of the survey upwards; |  |  |  |  |  |  |  |  |  |  |  |  |  |
| G: the percentage represented by the figure in $F$. |  |  |  |  |  |  |  |  |  |  |  |  |  |

With a few exceptions, especially at the beginning and end of the list, the product of $f$ and $r$ varies within relatively narrow limits. This is in accordance with the findings of G.K. Zipf, who observed that the product fr is constant. He saw in this symmetry a balance struck between two opposing forces: the greatest ease intended on the part of the speaker, and the greatest clarity desired by the hearer. In other words, the two extremes are: the same word for all concepts that have to be expressed and a separate word for each of these concepts. (For more on these findings, see Bertil Malmberg, New Trends in Linguistics, Stockholm/Lund, 1964, p. 192) ${ }^{3}$.

It appears that the four most frequently used lexical units (only $1 / 2 \%$ ) account for more than one fourth of the total number of words, and that nineteen of these lexical units $(2.43 \%)$ account for half of the total number of words. This confirms one of the findings of Pierre Guiraud in Les Caractères statistiques du vocabulaire (Paris, 1954), namely that the greater part of a text is constituted by a very small number of words. (See especially p. 10).

In SR the nineteen most frequently used lexical units in order of frequency are: 1. definite article, demonstrative pronoun ${ }^{4}(782 \mathrm{x})$; 2. personal pronoun of 3rd person (547 x); 3. ende (299 x); 4. wessa (200 x); 5. to (188 x); 6. so(e) (186 x); 7. schil (168 x); 8. conjunction dat (167 x); 9. mit (117 x); 10. ief (103 x); 11. and 12. noun riucht $(93 \mathrm{x})$, $\sin (93 \mathrm{x}) ; 13 . o(e) n(83 \mathrm{x}) ; 14$. aegh ( 78 x ); 15. een (77 x); 16. and 17. relative particle deer (65 x), habba (65 x); 18. ma (61 x); 19. adverb deer (58x).

Although conclusions from a text as limited in size as SR are not to be drawn, and this text is not comparable with, e.g., the material on which N.R. French, The Words and Sounds of Telephone Conversations, Bell System Technical Journal, 9 (1930), pp. 290-324, and G. Dewey, Relative Frequency of English Speech Sounds (Cambridge, Mass., 1923), based their research, it is noticeable that the results mentioned before in this study are much closer to the findings of French, whose material consisted of spoken language, than to those of Dewey, who investigated written language. In Dewey's text, sixty-seven lexical units accounted for half the number of words examined; in French's, thirty. This fact might be another indication, not mentioned in Chapter 11 of my Word-Groups $\ldots$, of the influence on SR of spoken language ${ }^{5}$.
Ede
A. Bor

NOTES:

1. The edition used for this analysis is the one that is to appear in the series Oudfriese Taalen Rechtsbronnen at some time in the future. Its publication has been delayed by the death of K. Fokkema, its original editor. Part of a proof copy of the forthcoming edition appeared as an auxiliary booklet with my Word-Groups in the Language of the Skeltana Riucht (Wageningen, 1971).
2. See G.A. Miller, Language and Communication (New York, 1963), p.89.
3. A few other works in the same field are: G.U. Yule, The Statistical Study of Literary Vocabulary (Cambridge, 1944); G. Herdan, Language as Choice and Chance (Groningen, 1956); G.C. Lepschy, A Survey of Structural Linguistics (London, 1970), pp. 140-145.
4. Generally speaking $S R$ has the same word to represent a definite article and a demonstrative pronoun. See my Word-Groups..., note 3 to Chapter 1 on p. 219, and p. 28.
5. The various word-classes in SR are represented in the following numbers and percentages: pronouns - 1690 ( $24.65 \%$ ); nouns - 1441 ( $21.01 \%$ ); verbs - 1352 (19.72 \%); conjunctions - 752 ( $10.97 \%$ ); prepositions - 604 ( $8.81 \%$ ); adverbs - 562 ( $8.19 \%$ ); numerals - 268 (3.91 \%); adjectives - 188 (2.74 \%).
